

## COVID-19 Update September 10, 2020

As of **September 09, 2020, at 8:30 PM**, the total of laboratory-confirmed and probable COVID-19 cases reported among Connecticut residents is **54093**, including **51877** laboratory-confirmed and **2216** probable cases. **Fifty-two** patients are currently hospitalized with laboratory-confirmed COVID-19. There have been **4478** COVID-19-associated deaths.

In Connecticut during the early months of this pandemic, it became clear that it would be necessary to track probable COVID-19 cases and deaths, in addition to laboratory-confirmed (RT-PCR) cases and deaths. This was needed to better measure the burden and impact of this disease in our communities and is now part of the [national surveillance case definition for COVID-19](#). Probable cases of COVID-19 involve persons who have not had confirmatory laboratory testing (RT-PCR) performed for COVID-19 but whose symptoms indicate they are likely to have a COVID-19 infection. In Connecticut, most of the probable COVID-19 cases involve persons whose death certificates list COVID-19 disease or SARS-CoV-2 as a cause of death or a significant condition contributing to death. Prior to June 1, probable and confirmed cases were reported together.

Overall Summary	Total**	Change Since Yesterday
COVID-19 Cases	54093	+222
COVID-19-Associated Deaths	4478	+4
Patients Currently Hospitalized with COVID-19	52	-5
COVID-19 PCR Tests Reported	1307244	+16602

\*\*Includes confirmed plus probable cases

### COVID-19 Cases and Associated Deaths by County of Residence

*As of 09/09/20 8:30pm.*

County	COVID-19 Cases		COVID-19-Associated Deaths	
	Confirmed	Probable	Confirmed	Probable
Fairfield County	18495	765	1103	314
Hartford County	13186	667	1109	321
Litchfield County	1684	79	119	20
Middlesex County	1440	65	155	38
New Haven County	13445	472	960	150
New London County	1581	68	82	27

Windham County	818	10	14	1
<i>Pending address validation</i>	<i>100</i>	<i>3</i>	<i>0</i>	<i>0</i>
<b>Total</b>	<b>51877</b>	<b>2216</b>	<b>3593</b>	<b>885</b>

[National COVID-19 statistics](#) and information about [preventing spread of COVID-19](#) are available from the Centers for Disease Control and Prevention.

**Day-to-day changes reflect newly reported cases, deaths, and tests that occurred over the last several days to week.** All data in this report are preliminary; data for previous dates will be updated as new reports are received and data errors are corrected. Hospitalization data were collected by the Connecticut Hospital Association. Deaths reported to either OCME or DPH are included in the daily COVID-19 update.

## COVID-19 Cases and Deaths Over Time

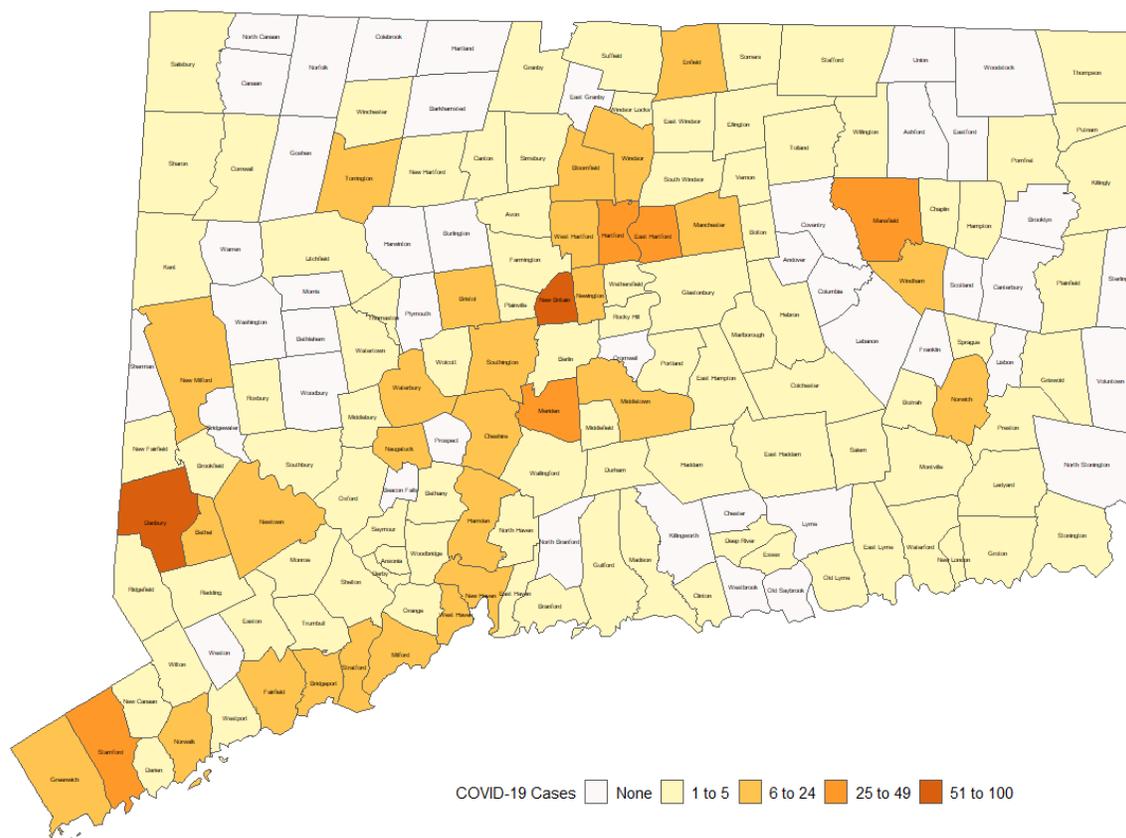

### New Cases during August 30–September 5, 2020

Among 97,276 PCR tests for COVID-19 with specimen collection date during August 30–September 5, 963 test results were positive. There were 835 people who tested positive for the first time or had onset of symptoms during August 30–September 5. Of these 835 people, 812 (97%) cases were among people who reside in community settings and 23 (3%) were among people who reside in congregate settings, including nursing homes, assisted living facilities, or correctional facilities.

The maps below show the distribution of the 812 cases among people living in community settings. The first map shows the number of cases and darker colors indicate towns with more cases.

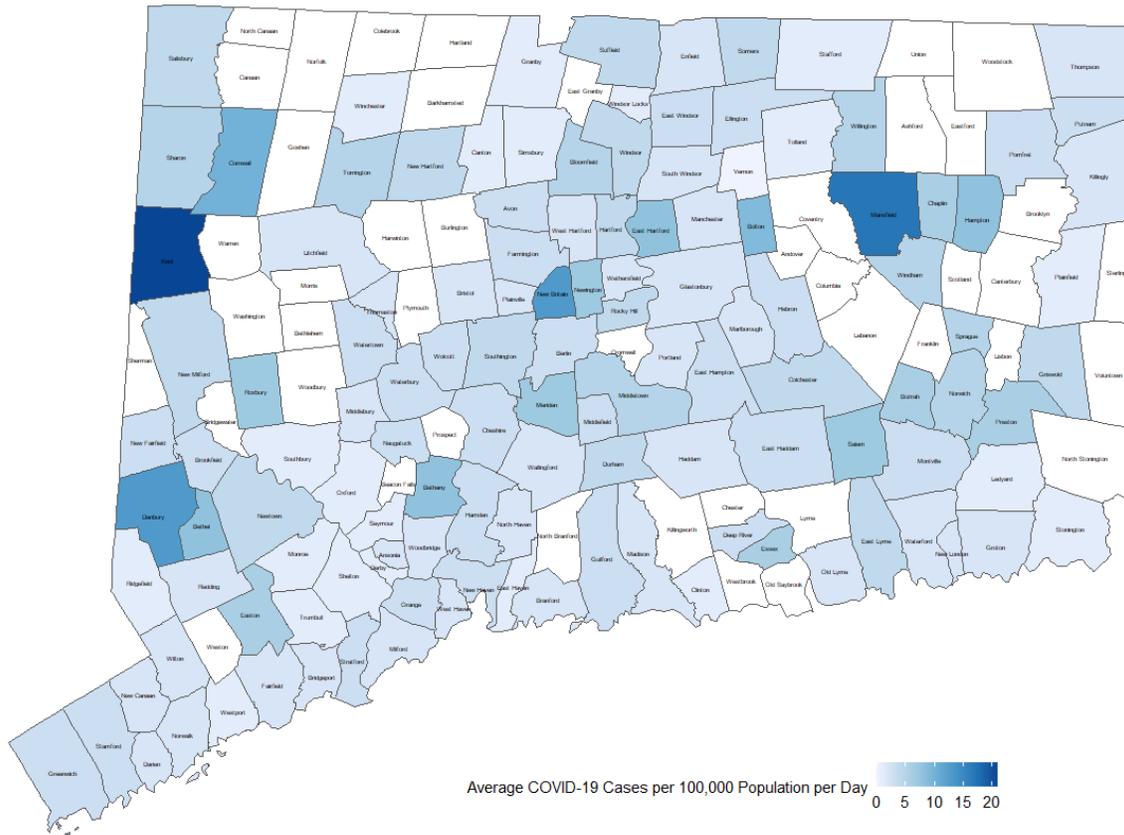

Because towns with larger populations are likely to have more cases, it is also important to look at the number of new cases per 100,000 population. The second map below shows the number of new cases per 100,000 population, with darker colors indicating higher rates.

Number of COVID-19 Cases among Persons Living in Community Settings by Town with Specimen Collection or Onset Date During August 30-September 5

*Map does not include 3 cases pending address validation.*

Average Daily Rate of COVID-19 Cases among Persons Living in Community Settings per 100,000 Population by Town with Specimen Collection or Onset Date During August 30-September 5

*Map does not include 3 cases pending address validation.*

**Population, Number and Average Daily Rate of COVID-19 Cases among Persons Living in Community Settings by Town with Specimen Collection or Onset Date during August 30–September 5, 2020**

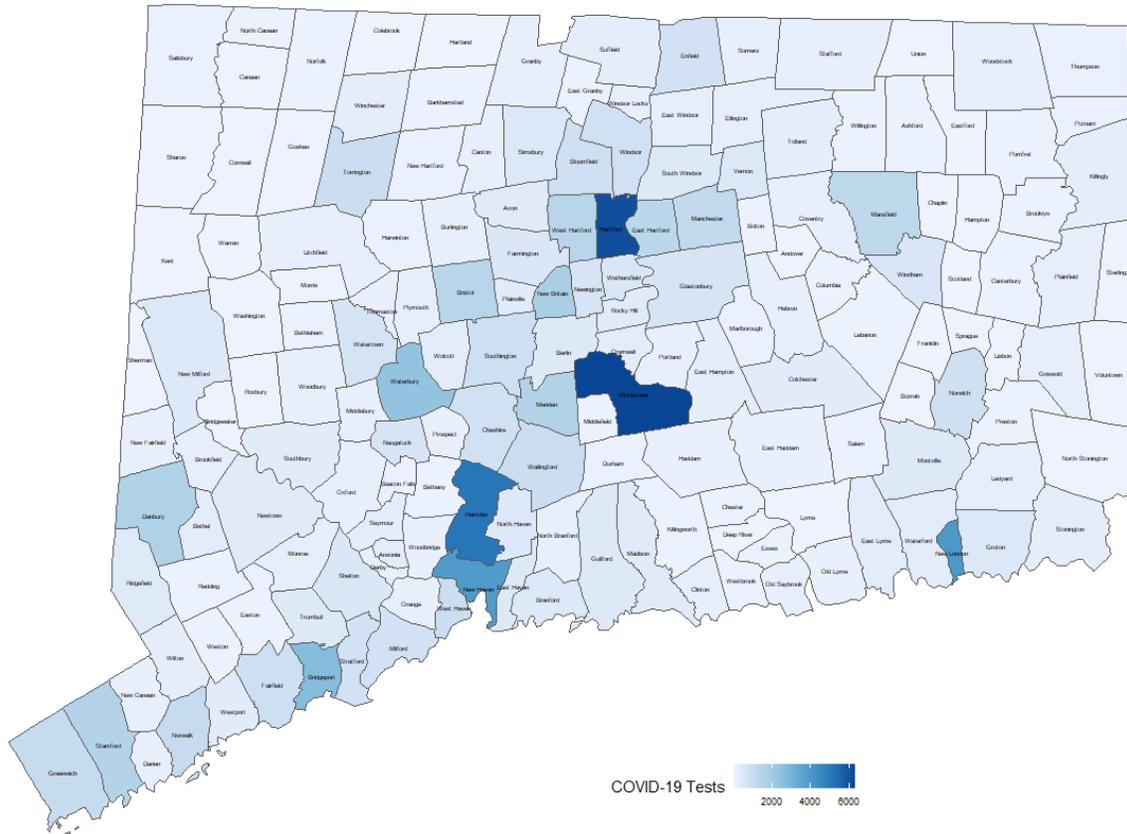

*Table does not include 3 cases pending address validation. Daily rate is average number of cases per day per 100,000 population.*

## COVID-19 PCR Tests during August 30–September 5, 2020

Among 97,276 PCR tests for COVID-19 with specimen collection date during August 30–September 5, 87,466 (90%) tests were conducted among people who did not reside in congregate settings (including nursing homes, assisted living, and correctional facilities). Of these 87,466 tests, 852 (1%) were positive. The map below shows the number of PCR COVID-19 tests by town with specimen collection date during August 30–September 5 that were conducted among community residents.

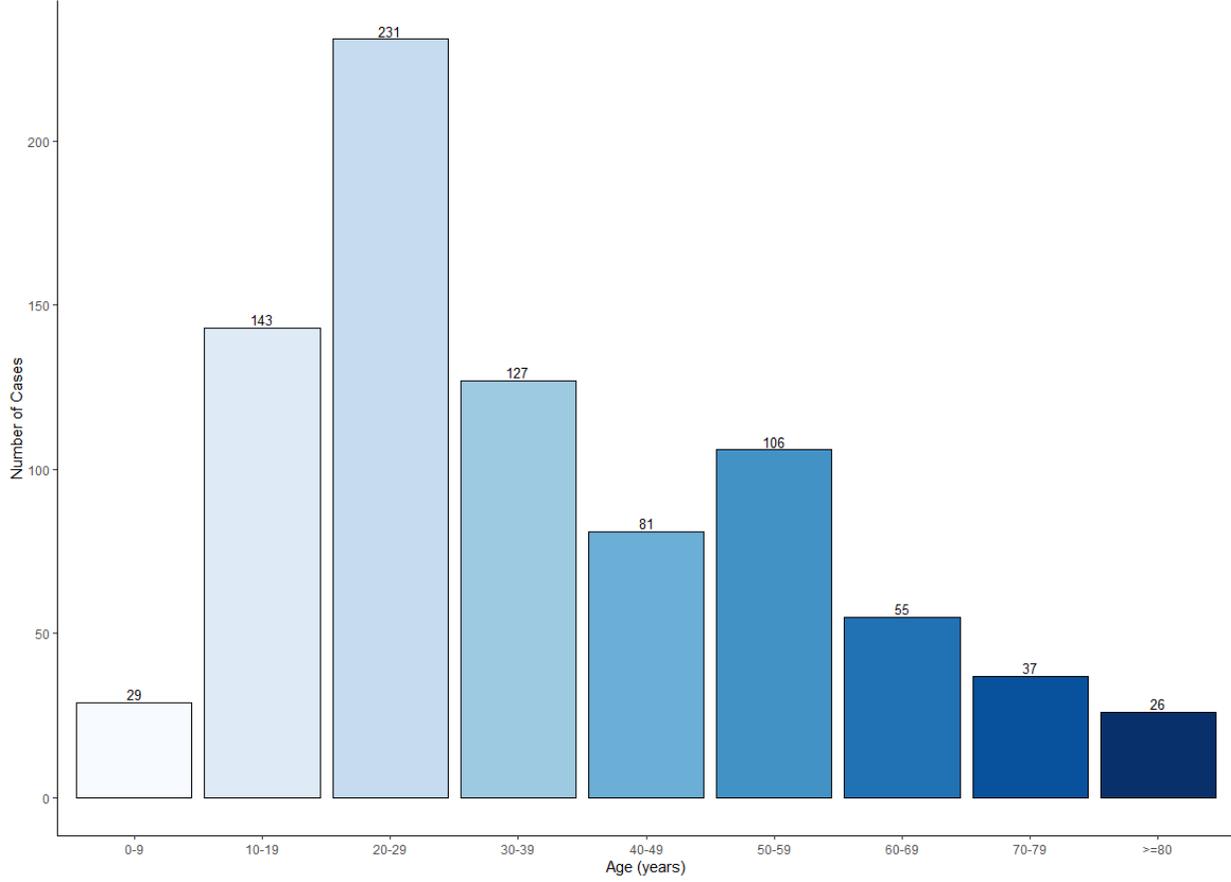

Number of PCR Tests for COVID-19 among Persons Living in Community Settings by Town with Specimen Collection Date During August 30-September 5

*Map does not include 2729 test results pending address validation.*

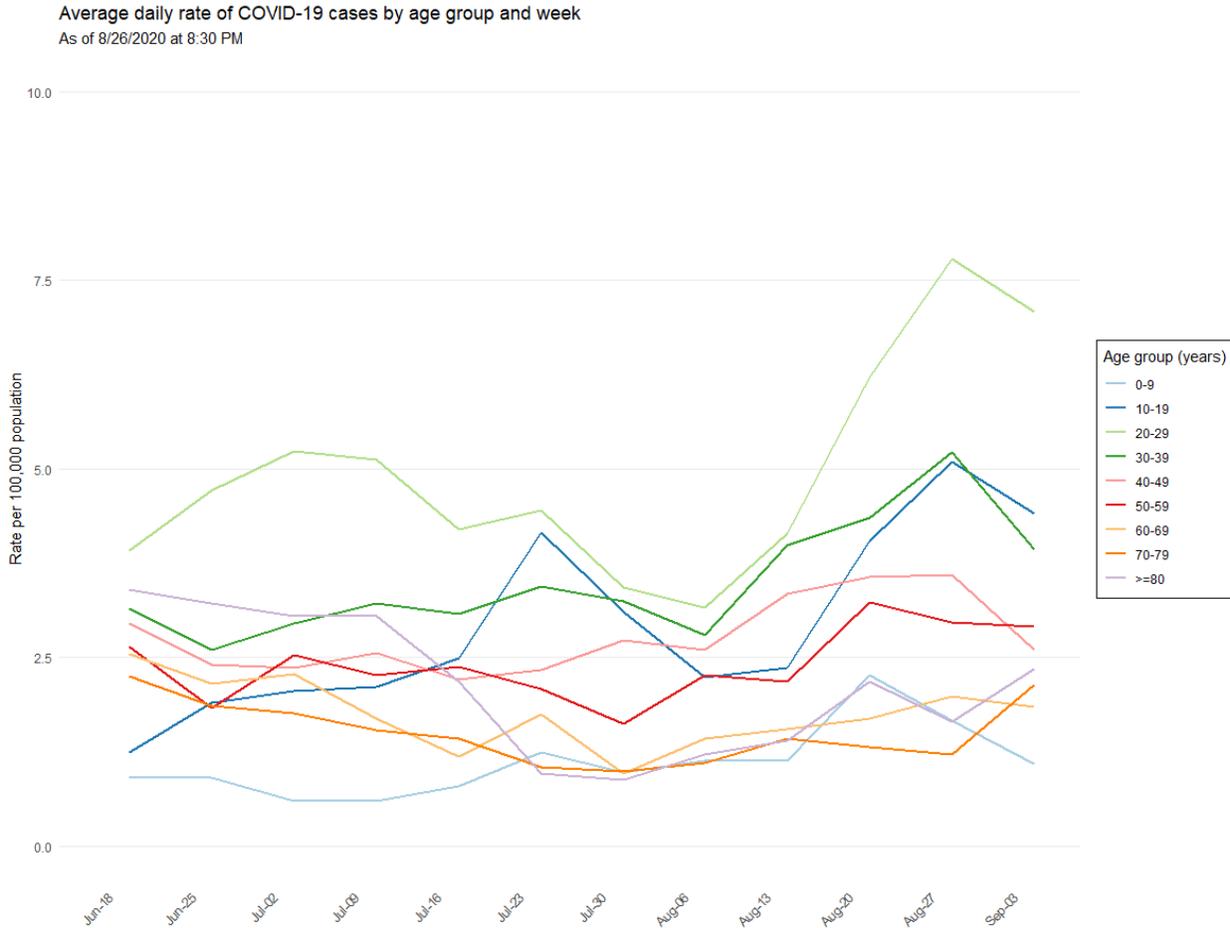

## Age Distribution of COVID-19 Cases with Specimen Collection or Onset During August 30–September 5, 2020

Number of New COVID-19 Cases by Age Group with Collection or Onset during August 30-September 5  
As of 09/09/2020 at 8:30PM

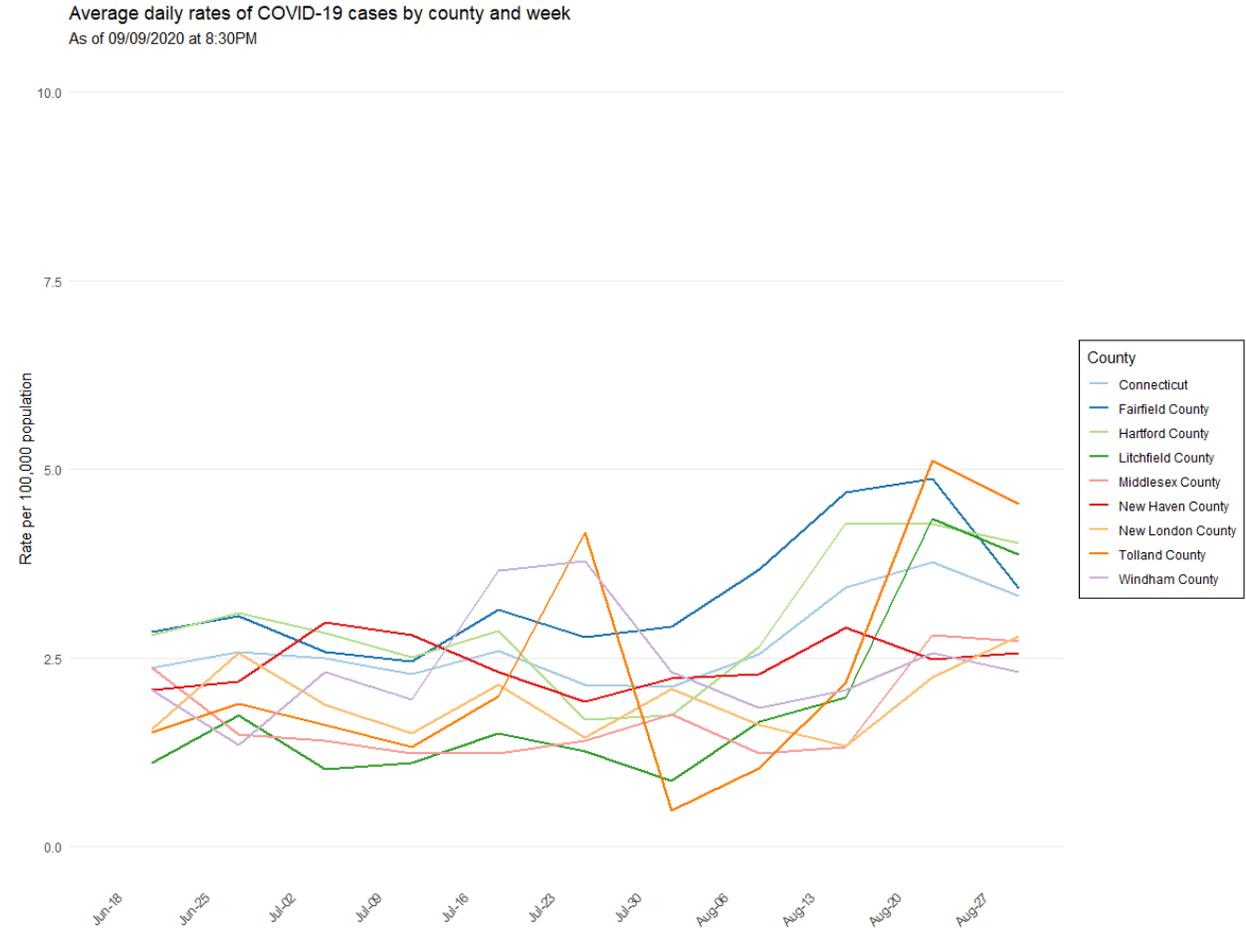

## Average Daily Incidence by Age Group

The chart below shows the average number of new COVID-19 cases per day per 100,000 population by week by age group. The rates in this chart are calculated by dividing the average number of new cases diagnosed per day each week by the annual estimated population in each age group and then multiplying by 100,000. The rate calculation used here is similar to the [CDC COVID-19 Data Tracker](#) method for calculation of cumulative COVID-19 incidence rates.

## Average Daily Incidence by County

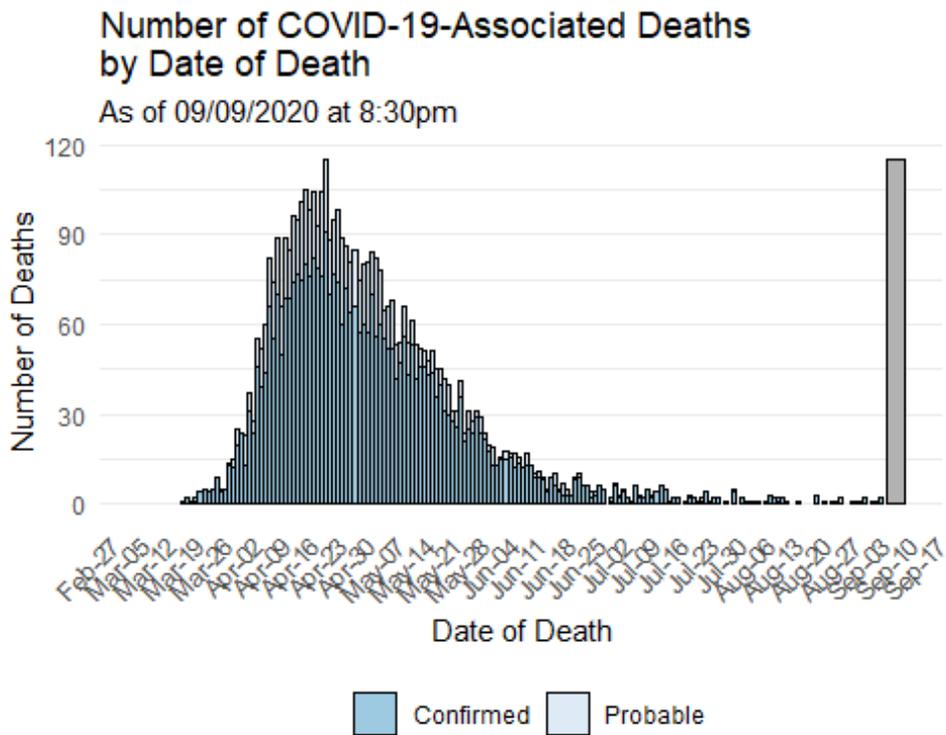

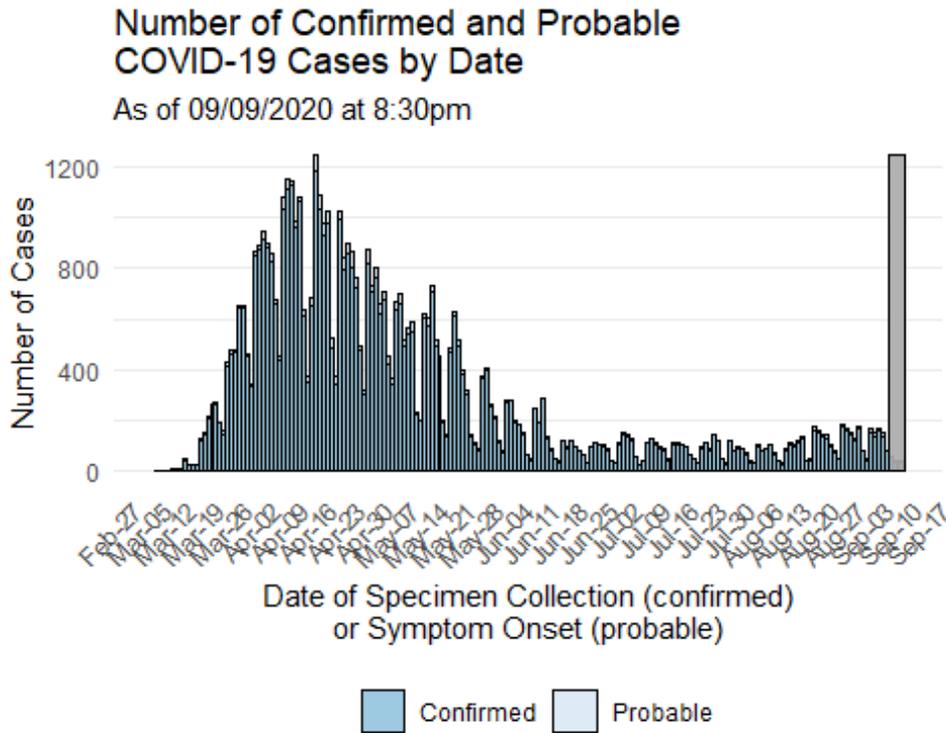

The chart below shows the average number of new COVID-19 cases per day per 100,000 population by week in the state of Connecticut and for each Connecticut county. The rates in this chart are calculated by dividing the average number of new cases diagnosed per day each week by the annual estimated population and then multiplying by 100,000. The rate calculation used here is similar to the [CDC COVID-19 Data Tracker](#) method for calculation of cumulative COVID-19 incidence rates.

*Notes: Incidence rates are based on average cases per day for each week divided by the estimated annual population and multiplied by 100,000. Cases pending address validation are excluded from rate calculations.*

## Cumulative Number of COVID-19 Cases and COVID-19-Associated Deaths by Date

Test results may be reported several days after the result. Data are incomplete for most recent dates shaded in grey. Data from previous dates are routinely updated.

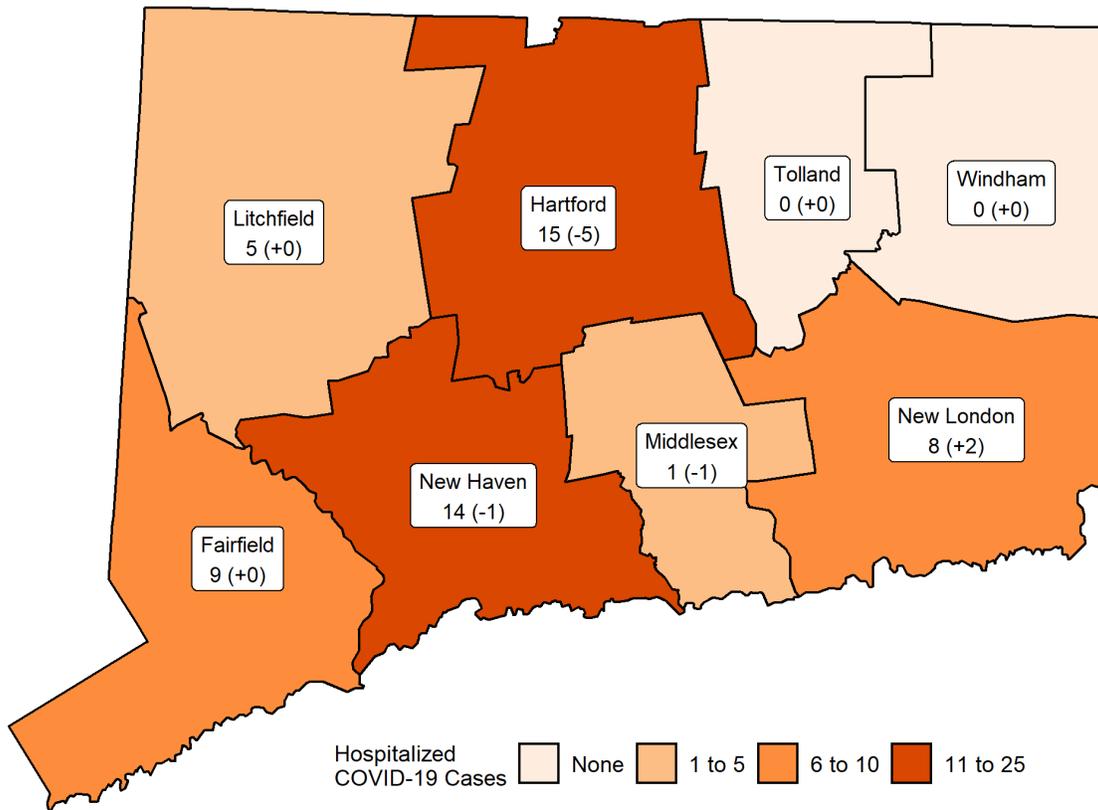

## Hospitalization Surveillance

The map below shows the number of patients currently hospitalized with laboratory-confirmed COVID-19 by county based on data collected by the Connecticut Hospital Association. The distribution is by location of hospital, not patient residence. The labels indicate the number of patients currently hospitalized with the change since yesterday in parentheses.

### Patients Currently Hospitalized by Connecticut County

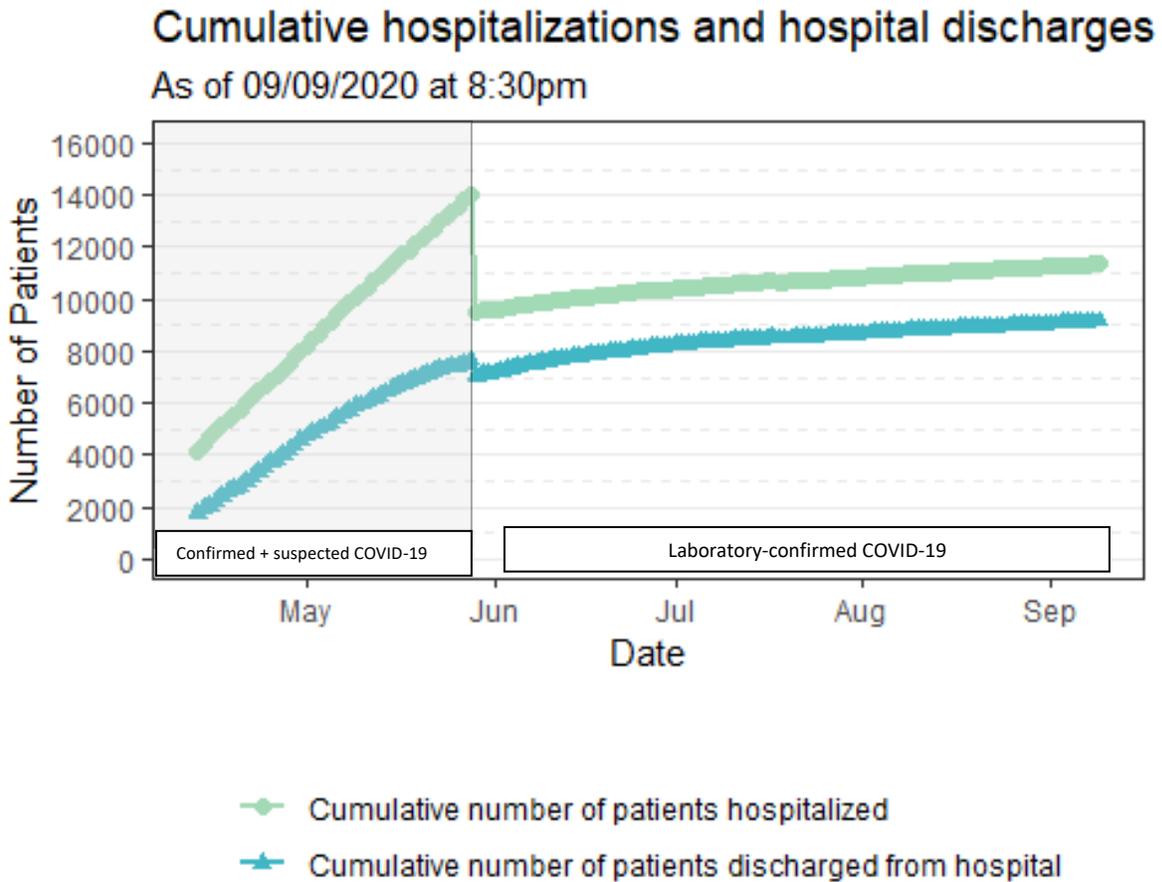

*Distribution by location of hospital not patient residence. Data from the Connecticut Hospital Association.*

More information about hospitalized cases of COVID-19 in New Haven and Middlesex Counties is available from [COVID-NET](#).

## Cumulative hospitalizations and cumulative hospital discharges for COVID-19

The chart below shows information on cumulative hospitalizations and hospital discharges for patients with COVID-19. Data were collected by the Connecticut Hospital Association. Starting on May 29, 2020, CHA changed to reporting only the number of patients with laboratory-confirmed COVID-19; data for previous dates include patients with laboratory-confirmed or suspected COVID-19. To date, **11357** patients have been hospitalized with laboratory-confirmed COVID-19 in Connecticut and **9142** patients hospitalized with laboratory-confirmed have been discharged.

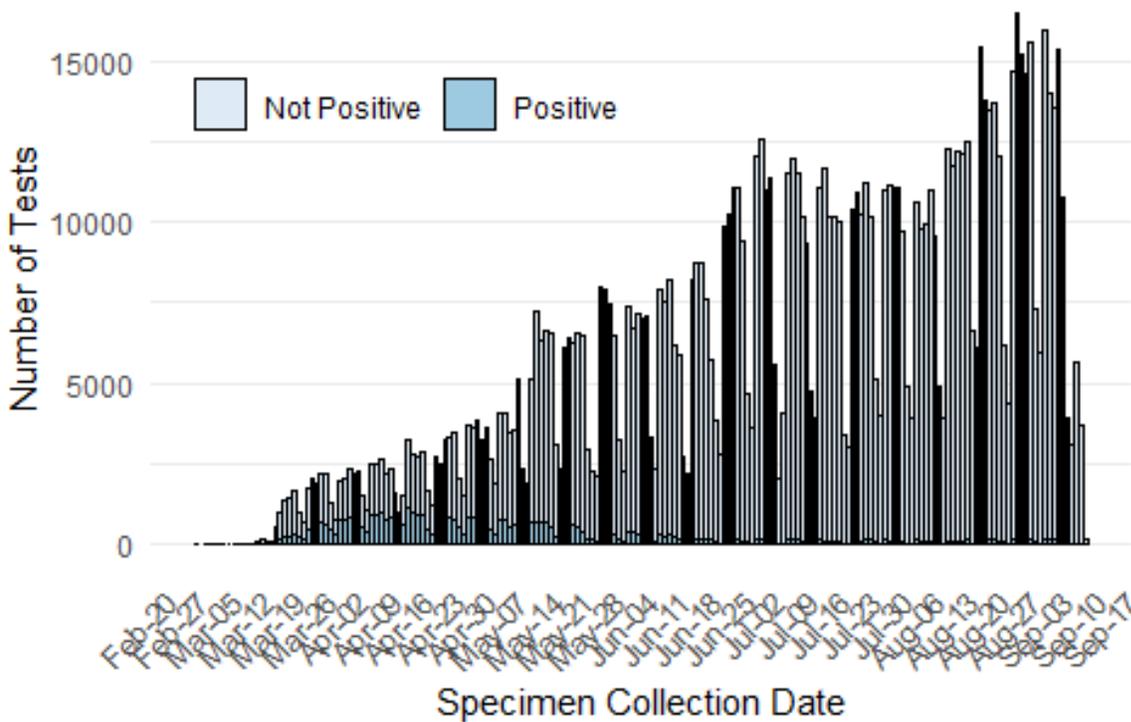

## Laboratory Surveillance

To date, DPH has received reports on a total of 1307244 COVID-19 laboratory tests; of these 1124807 test results were received via electronic laboratory reporting (ELR) methods from commercial laboratories, hospital laboratories, and the Dr. Katherine A. Kelley State Public Health Laboratory. The chart below shows the number of tests reported via ELR by date of specimen collection and test result.

### Number of Laboratory Tests for COVID-19 Reported via ELR by Specimen Collection Date

As of 09/09/2020 at 8:30pm

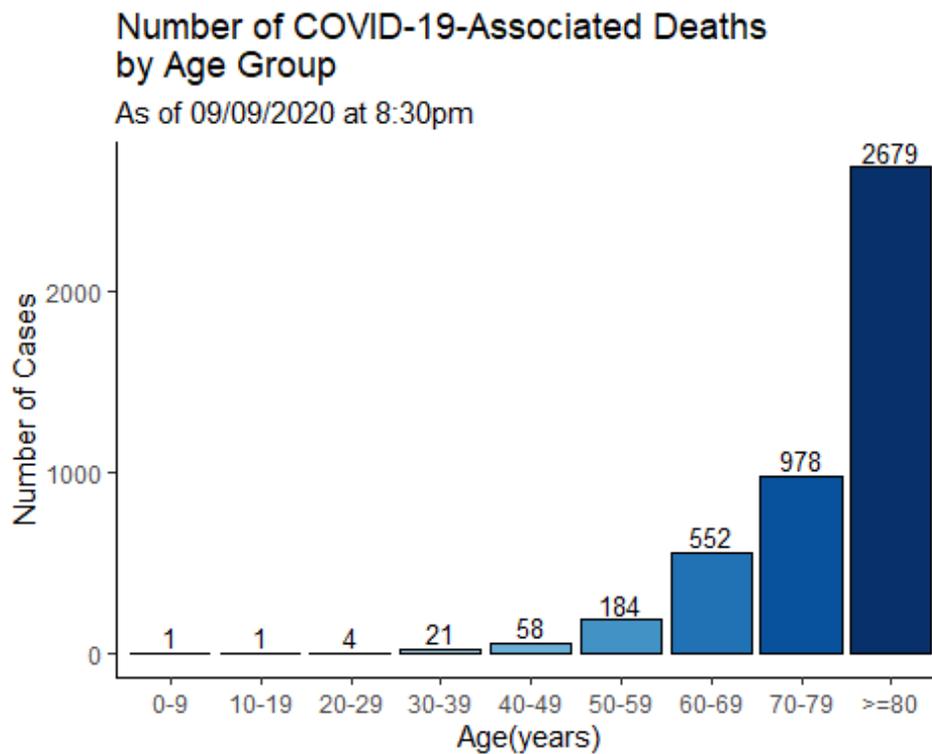

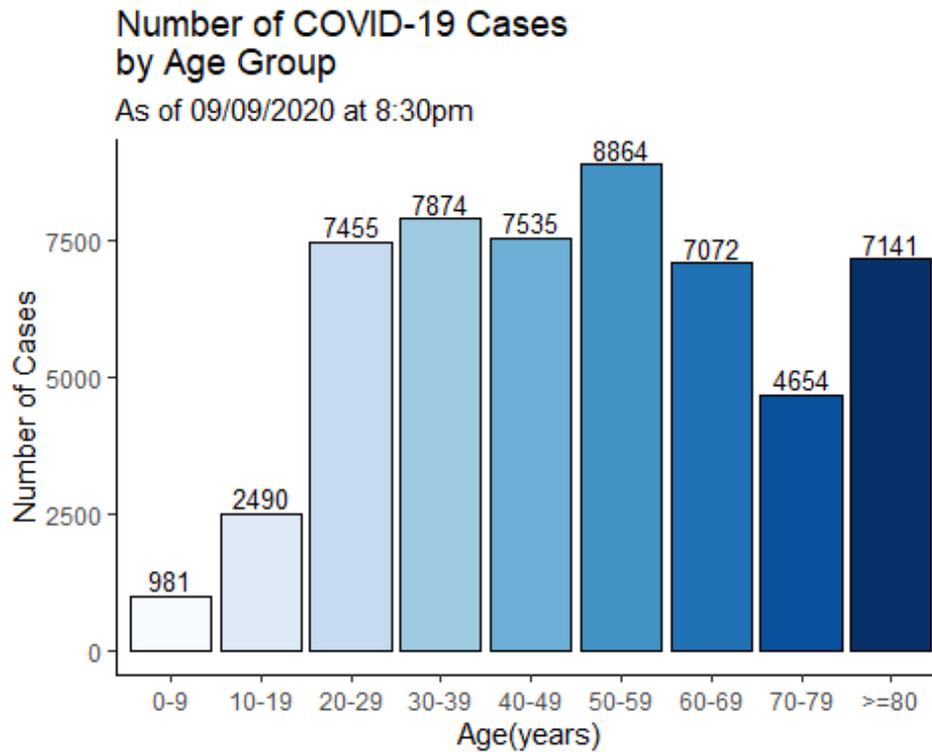

*Testing of specimens collected since September 7 is ongoing and does not reflect a decrease in testing. Chart only includes test results received by electronic laboratory reporting.*

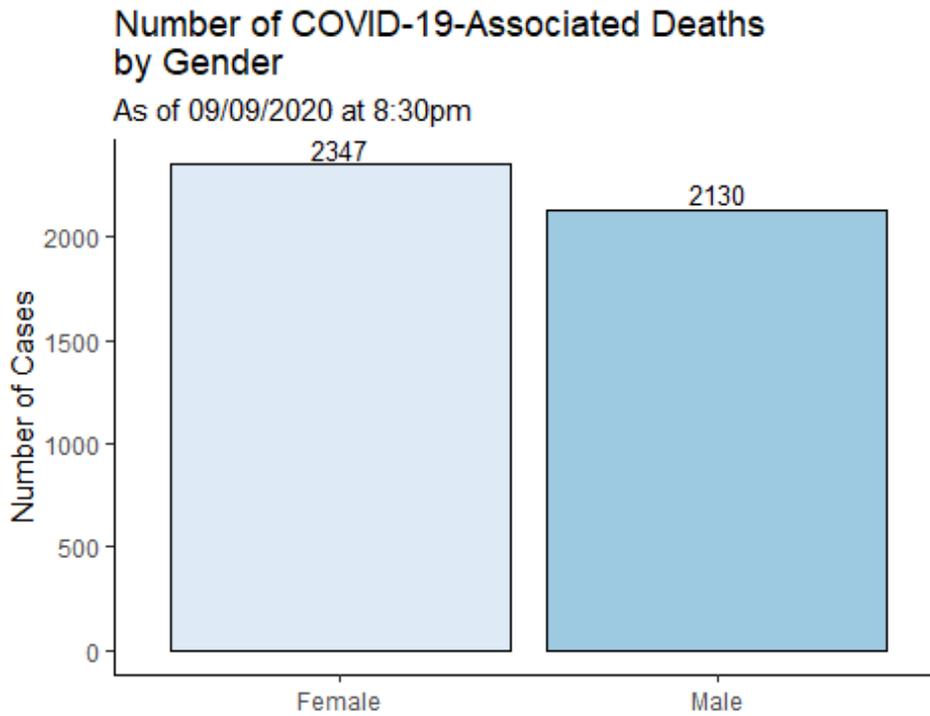

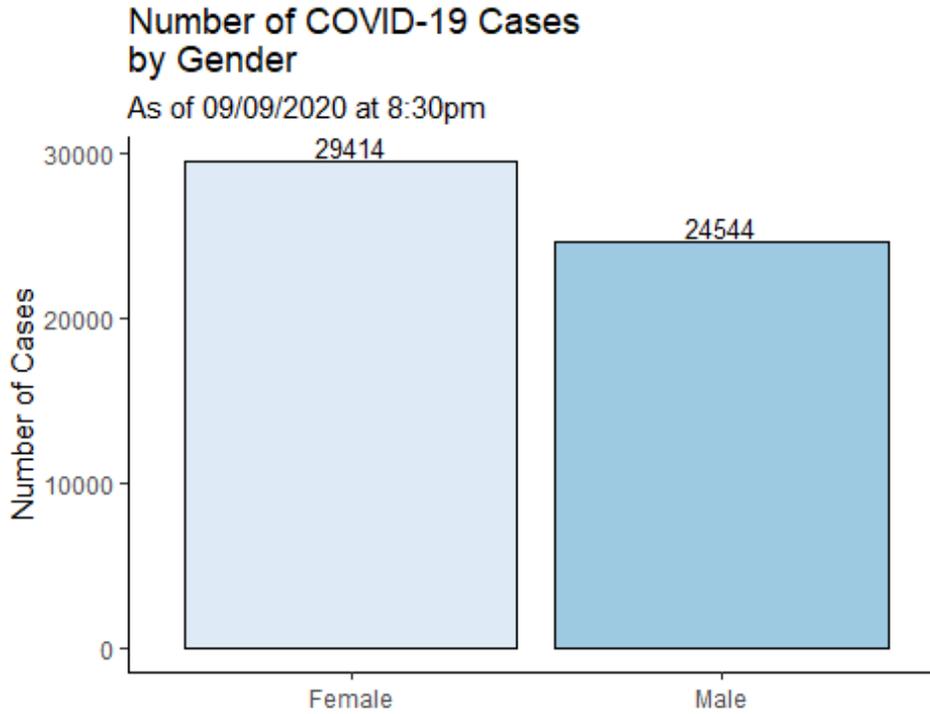

*ELR = Electronic Laboratory Reporting*

## Characteristics of COVID-19 Cases and Associated Deaths

Counts may not add up to total case count because demographic data may be missing.

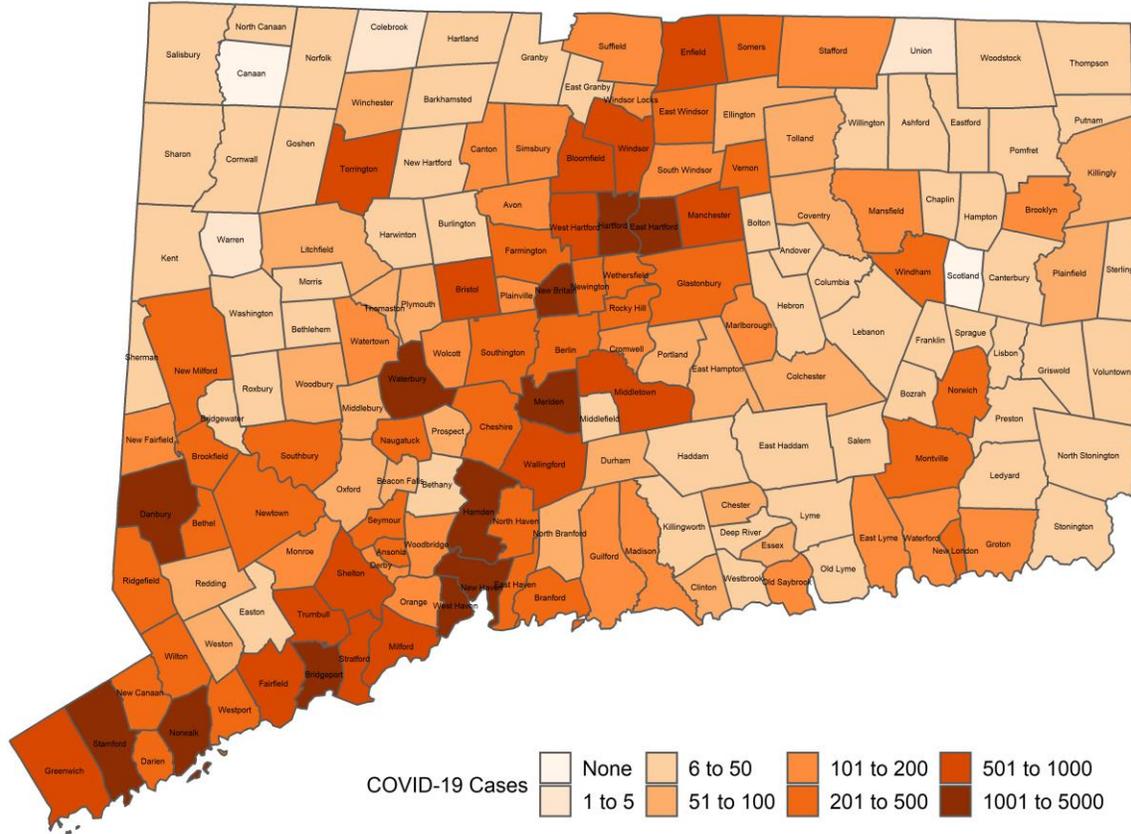

Counts may not add up to total case count because demographic data may be missing.

## Cumulative Number of COVID-19 Cases by Town

Map does not include 103 cases pending address validation

All data are preliminary and subject to change.

## APPENDIX A. Cumulative Number of COVID-19 Cases by Town

As of 09/09/2020 at 8:30pm

**APPENDIX C.** The following graphs show the number of cases and deaths by race and ethnicity. Categories are mutually exclusive. The category “multiracial” includes people who answered ‘yes’ to more than one race category. NH=Non-Hispanic

The following graphs show the number of COVID-19 cases and COVID-19-associated deaths per 100,000 population by race and ethnicity. Crude rates represent the total cases or deaths per 100,000 people. Age-adjusted rates consider the age of the person at diagnosis or death when estimating the rate and use a standardized population to provide a fair comparison between population groups with different age distributions. Age-adjustment is important in Connecticut as the median age of among the non-Hispanic white population is 47 years, whereas it is 34 years among non-Hispanic blacks, and 29 years among Hispanics. Because most non-Hispanic white residents who died were over 75 years of age, the age-adjusted rates are lower than the unadjusted rates. In contrast, Hispanic residents who died tend to be younger than 75 years of age which results in higher age-adjusted rates.

The 2018 Connecticut and 2000 US Standard Million populations were used for age adjustment; population estimates from: [DPH Population Statistics](#). Categories are mutually exclusive. Cases missing data on race/ethnicity are excluded from calculation of rates. NH=Non-Hispanic

\*Age adjusted rates only calculated for groups with at least 30 deaths
